THREE-MARKET SELECTED PANEL · CHECKED-IN PROSPECTIVE DUSK DEFAULTS

Keep V1. Dusk defaults do not beat the accessible historical evidence.

The exact replay now completes, but the combined benchmark score remains unavailable. The individually available fields still show materially lower Dusk borrowing capacity and economic revenue; spot and full leverage comparisons remain unavailable and are not estimated.

> **Decision:** do not replace V1 with the checked-in Dusk defaults. Continue Dusk tuning only if a later frozen profile clears the missing spot, leverage, capital-window, and external-state evidence.

Generated 2026-08-23T05:13:49Z · run slot-440459364-06c0e05aadb7e883 · profile d34eb2a34ed5… · both replay arms agree

-64.56%
Dusk actionable additional headroom vs V1

-69.30%
Dusk actionable total debt capacity vs V1

$1,434.64
V1 factual-user-flow economic revenue

$0.744
Dusk factual-user-flow economic revenue

The four original questions

1 · V1 WINS ACCESSIBLE EVIDENCE

Collateral efficiency

Matched borrow prestates	**1,227**
Actionable additional headroom	**V1 $153,262** **Dusk $54,315**
Actionable total capacity	**V1 $202,284** **Dusk $62,110**
Observed debt increase filled	**Dusk 19.58% of V1**

Dusk left $21,631 of matched borrow demand unmet.

2 · NOT AVAILABLE

Spot capital efficiency

Comparable swap notional	**$0**
Execution cost / slippage	**N/A**
Standardized probes	**N/A**

The defaults produced no comparable priced swap-execution sample. That prevents any Dusk spot advantage claim; it is not evidence that execution cost is zero.

3 · CAPACITY RESULT ONLY

Leverage and margin safety

Full loop / unwind campaign	**N/A**
Dusk gross capacity vs V1 actionable	**74.04%**
Dusk actionable vs V1 actionable	**30.70%**
Observed bad debt	**V1 $0 · Dusk $0**

V1 wins executable capacity. Zero bad debt is reassuring but does not prove better Dusk margin safety; adverse-path and full-unwind evidence is unavailable.

4 · V1 WINS ACCESSIBLE EVIDENCE

LP and protocol economics

Economic revenue	**V1 $1,434.64** **Dusk $0.744**
Dusk delta	**-99.948%**
Dusk swap-fee revenue	**$0.00**
Dusk public-interest revenue	**$0.744**

Maximum-feasible hLP funding includes 77 deferred external-state operations, so hLP yield and complete capital-normalized APY remain N/A.

Why Dusk capacity was lower

Counts can overlap because multiple constraints may bind the same matched prestate. Cash and reduce-only each limited 0 observations.

Market evidence

MARKET	BORROW OBS.	LIQUIDATIONS	V1 REVENUE ($)	DUSK REVENUE ($)	MISSING CAPITAL MARKS
Fartcoin / USDC spot archetype	0	0	221.31	0.000	9
stORE / USDC borrowing archetype	1,106	6	378.45	0.690	10
OMFG / USDC liquidation archetype	121	7	834.88	0.054	74

What this verdict does—and does not—mean

Accessible-evidence decision, not global certification. The replay completed but `complete_for_scoring=false` because 77 external-state operations were deferred. The scorer also lacks a capital checkpoint for the first 64 seconds of the Fartcoin market window and has 93 counterfactual capital price-hour gaps. Therefore the combined score, execution-cost/slippage metrics, capital-normalized yield, and full leverage campaign remain unavailable. Individually available capacity, revenue, and bad-debt fields are reported because both replay arms agree exactly on them.

Scope and sources

- Three report markets: Fartcoin/USDC (spot), stORE/USDC (borrowing), OMFG/USDC (liquidations).
- Training window: 2026-04-15 20:00 UTC to 2026-06-30 19:20:34 UTC.
- Dusk configuration: checked-in prospective program defaults, not a deployed production configuration and not a calibrated winner.
- Underlying replay inputs contain five selected markets for required state continuity; every numerical headline above is filtered to the exact three-market report set.
